## AMENDMENTS TO THE SPECIFICATION

### In the Specification:

Please enter the following amendments to the specification.

Please amend the paragraph beginning on page 13, line 13 as follows:

Such latch curling is obtained by applying longitudinal tension in the opposite direction (i.e. trying to withdraw penetrant cells rather than thread them). Again, the additional ~~notch 29~~ notch 15 can greatly assist in this process since it promotes easier latch curling, and this can only be upwards because the enclosed target 35 actually prevents the latches from curling downwards. Hence the advantageous upwards curl is largely automatic at this stage (Figure 20).

No new matter has been introduced by these changes to the specification.
